Professional Summary

- Angular Developer with 5 years of experience designing and building scalable, high-performance enterprise SPAs using Angular (v8–v17), TypeScript, and JavaScript (ES6+).
- Hands-on with modern Angular architecture — Standalone Components, Signals, and the new `@if/@for` control-flow syntax — alongside NgRx state management, RxJS, Reactive Forms, lazy-loaded modules, route guards, and HTTP interceptors.
- Experienced integrating RESTful APIs, writing unit tests (Jasmine/Karma), and working within CI/CD-driven build and deployment pipelines.
- Background spans recruitment tech, IT service management, and healthcare (HIMS) domains, with a focus on responsive UI (Angular Material/Bootstrap), performance optimization, and clean, maintainable code.
- Comfortable in Agile/Scrum teams — sprint planning, code reviews, and cross-functional collaboration with backend and QA.

Skills

- Angular (v8–v17+), Standalone Components, Signals, Modern Control Flow (`@if/@for`), TypeScript, JavaScript (ES6+)
- RxJS (Observables, Subjects, Operators), NgRx (Store, Actions, Effects, Selectors)
- Reactive Forms, Template-driven Forms, Form Validations, Custom Directives, Pipes
- HTML5, CSS3, Bootstrap, Angular Material, Responsive UI
- REST API Integration, HttpClient, JSON, Interceptors
- Component-based Architecture, Modules, Services, Dependency Injection, Routing, Lazy Loading, Route Guards
- Unit Testing: Jasmine, Karma
- CI/CD Pipelines, Build & Deployment Automation
- Git, GitHub, Version Control, Code Management
- Chrome Developer Tools, Debugging, Performance Optimization
- Agile/Scrum, SDLC, Code Reviews, Sprint Planning
- Postman, API Testing, Swagger (Basic)

Professional Experience

Software Engineer — Saince Healthtech Pvt Ltd (April 2026 – Till Date)

Software Engineer — Accenture (MSRcosmos Group Pvt Ltd) (Jan 2023 – Feb 2026)

Associate Software Engineer — VisionQuest Solution Pvt Ltd (Oct 2021 – Dec 2022)

Educational Qualification

- Completed BE from VIT (2022).

Project 1

Project: Hospital Information Management System (HIMS)

Environment: Angular (v17), Standalone Components, Signals, TypeScript, NgRx, RxJS, Angular Material, Bootstrap, REST APIs, JWT Authentication, Jasmine, Karma, CI/CD (GitHub Actions), HTML5, CSS3, GitHub, Jira

Description: A healthcare management platform enabling hospitals and clinics to manage patient records, appointment scheduling, doctor consultations, and billing workflows. The system provides role-based dashboards for admin, doctors, and front-desk staff with real-time updates across departments.

Responsibilities:

- Migrated legacy NgModule-based feature areas to Standalone Components and introduced Signals for local reactive state in the patient and appointment modules
- Adopted the new `@if/@for` control-flow syntax while refactoring the patient dashboard templates, simplifying conditional/list rendering
- Built dynamic Reactive Forms (FormGroup/FormArray) with custom validators for patient registration and clinical intake
- Implemented NgRx for centralized state management across appointment scheduling and billing workflows
- Implemented JWT-based authentication and RBAC (admin, doctor, front-desk) with AuthGuard/RoleGuard for secure navigation
- Wrote unit tests (Jasmine/Karma) for core services and components, [raised/maintained] test coverage to ~[X]%
- Contributed to the CI/CD pipeline (GitHub Actions) for automated lint, build, and test runs on pull requests
- Built the appointment calendar and doctor-availability scheduling UI with real-time status updates
- Collaborated with backend teams on clinical/billing API contracts within an Agile/Scrum delivery cycle

Project 2

Project: Applicant Tracking System (ATS)

Environment: Angular (v12+), TypeScript, NgRx, RxJS, Angular Material, Bootstrap, REST APIs, JWT Authentication, HTML5, CSS3, GitHub, Jira

Description: A recruitment management platform designed to streamline candidate sourcing, tracking, and onboarding workflows. The system supports role-based dashboards, real-time updates, and scalable architecture for handling enterprise-level hiring processes.

Responsibilities:

- Developed modular Angular architecture with lazy-loaded feature modules for candidate, job, and onboarding workflows
- Implemented NgRx store/actions/effects for candidate pipeline state management
- Built multi-step Reactive Forms (FormArray) for candidate applications, including resume upload with client-side validation
- Integrated REST APIs using RxJS operators (switchMap, forkJoin, catchError) for async candidate and job data
- Implemented JWT authentication and RBAC for recruiter, hiring manager, and candidate roles
- Designed reusable directives and pipes for candidate search, filtering, and status tracking
- Improved rendering performance for large candidate lists using OnPush change detection and trackBy, cutting list re-render time by [X]%

Project 3

Project: Ticketing & Issue Tracking System

Environment: Angular, TypeScript, RxJS, Angular Material, Bootstrap, REST APIs, JWT Authentication, HTML5, CSS3, GitHub, Jira

Description: A ticketing and issue tracking platform designed to manage incidents, service requests, and bug tracking workflows across teams. The system enables users to raise, assign, track, and resolve tickets with real-time status updates

and role-based access control, improving operational efficiency and support management.

Responsibilities:

- Developed ticket CRUD operations and lifecycle workflow (Open, In Progress, Resolved, Closed) with priority/severity classification
- Implemented RBAC-based ticket visibility for Admin, Support, and User roles
- Built search, filtering, sorting, and pagination for large ticket datasets
- Built dashboard views for ticket status and performance metrics, using RxJS Observables for real-time updates
- Developed file attachment upload/download for issue evidence
- Debugged production issues using Chrome DevTools and improved error-interceptor logging, reducing average issue turnaround by [X]%
